

According to the **Brick Industry Association**, the #1 threat to masonry chimneys is **WATER**.

Don't leave your chimney untreated. Massive repairs to the chimney AND your house interior will cost you MUCH more than simple chimney maintenance.

The chimney is a system. The whole structure has to be treated to be effective.

That's where we come in to help!

How we do it:

CrownCoat & CrownSeal restore and protect the crown of the chimney.

ChimneySaver Water Repellent will bond with the masonry and provide long lasting water protection.

FlashSeal thoroughly seals the flashing, preventing any moisture from seeping into the chimney.

We Fix Leaky Chimneys®

The Cycle of Water Damage in a Leaky Chimney:

1 The crown is your chimney's first line of defense against the elements. A cracked or damaged crown allows water to enter and begins a cycle of deterioration.

2 An application of CrownCoat or CrownSeal fills open cracks and coats the entire crown with a durable watertight membrane that will last for years.

3 Water absorbed through the brick and mortar can cause brick delamination or spalling and be channeled into the interior of the house.

4 ChimneySaver Water Repellent stops water absorption and its detrimental effects and will not change the appearance of your chimney.

5 Loose, damaged, or missing flashing is a major source of water penetration and its resulting damage.

6 FlashSeal is like slipping a rubber boot over the base of your chimney, eliminating water and moisture intrusion.

Water penetration left unchecked causes **EXPENSIVE & EXTENSIVE** damage. Stop water leaks before they happen with ChimneySaver.®
